Gemini

```python
# %%
import pandas as pd
df = pd.DataFrame({
'School': ['S1', 'S1', 'S2', 'S2'],
'Class': ['A', 'B', 'A', 'B'],
'Age': [10, 12, 11, 13]
})
print("Original DataFrame:")
print(df)
grouped = df.groupby(['School', 'Class'])
print("\nGrouped DataFrame:")
for name, group in grouped:
    print("\nGroup:", name)
    print(group)
```

```
Original DataFrame:
  School Class  Age
0     S1     A   10
1     S1     B   12
2     S2     A   11
3     S2     B   13

Grouped DataFrame:

Group: ('S1', 'A')
  School Class  Age
0     S1     A   10

Group: ('S1', 'B')
  School Class  Age
1     S1     B   12

Group: ('S2', 'A')
  School Class  Age
2     S2     A   11

Group: ('S2', 'B')
  School Class  Age
3     S2     B   13
```
